Tensor data-type

- A majority of programming framework including Pytorch roughly provides 3 kinds of data-type, which are boolean, integer, floating point. These are divided by logical criteria.

		CPU Tensor		GPU Tensor
Data type		dtype		
Floating-point	32-bit floating point	<code>torch.float32</code> or <code>torch.float</code>		<code>torch.FloatTensor</code> → <code>torch.cuda.FloatTensor</code>
	64-bit floating point	<code>torch.float64</code> or <code>torch.double</code>		<code>torch.DoubleTensor</code> → <code>torch.cuda.DoubleTensor</code>
	16-bit floating point	<code>torch.float16</code> or <code>torch.half</code>		<code>torch.HalfTensor</code> → <code>torch.cuda.HalfTensor</code>
Integer	8-bit integer (unsigned)	<code>torch.uint8</code>		<code>torch.ByteTensor</code> → <code>torch.cuda.ByteTensor</code>
	8-bit integer (signed)	<code>torch.int8</code>		<code>torch.CharTensor</code> → <code>torch.cuda.CharTensor</code>
	16-bit integer (signed)	<code>torch.int16</code> or <code>torch.short</code>		<code>torch.ShortTensor</code> → <code>torch.cuda.ShortTensor</code>
	32-bit integer (signed)	<code>torch.int32</code> or <code>torch.int</code>		<code>torch.IntTensor</code> → <code>torch.cuda.IntTensor</code>
	64-bit integer (signed)	<code>torch.int64</code> or <code>torch.long</code>		<code>torch.LongTensor</code> → <code>torch.cuda.LongTensor</code>
Boolean	Boolean	<code>torch.bool</code>		<code>torch.BoolTensor</code> → <code>torch.cuda.BoolTensor</code>

Transfer CPU tensors into GPU tensors

```
import torch

device = 'cuda' if torch.cuda.is_available() else 'cpu'
x = torch.Tensor(3,3).uniform_(0,1)

print(x.type())           # torch.FloatTensor
print(x.to(device).type()) # torch.cuda.FloatTensor
```

CPU

GPU

GPU increased parallel process of operations as it has more Arithmetic logic units (ALU) compare to typical CPU

Figure: CPU vs GPU

Precision of floating-point(1)

```
tensor([[[ True,  True,  True,  True,  True],
         [False, False,  True, False, False],

```

 userdyk Dongmyeong Lee
Hi, all.
While checking the values of torch tensor, I have found a weird boolean or values between a, b on the captured photo are all the same, but, the book How come these the result was coming?

```
import torch
import torch.nn as nn

h_src = torch.Tensor(10,3,5).uniform_(0,1)
h_t_tgt = torch.Tensor(10,1,5).uniform_(0,1)

model = nn.Linear(5,5, bias=None)
a = model(h_src)
b = torch.einsum('lk,ijk->jl', [model.weight, h_t_tgt])

print(torch.eq(a.data, b.data))
print(a)
print(b)
```

 ptrblck 24d
To compare floating point numbers, which might have small errors due to the limited floating point precision, you should use `torch.isclose` or `torch.allclose` instead of a direct comparison.

LongTensor

```
In [31]: x = 2**63 - 1
         torch.tensor(x)

Out[31]: tensor(9223372036854775807)
```

```
In [32]: x = 2**63
         torch.tensor(x)

-----
RuntimeError
<ipython-input-32-98fac7
   1 x = 2**63
----> 2 torch.tensor(x)

RuntimeError: Overflow w
```

FloatTensor

```
In [86]: def test(n):
         a = torch.tensor(2**(-n)); print(f'a : {a}')
         b = 2**(-n); print(f'b : {b}')
```

test(149)

a : 1.401298464324817e-45
b : 1.401298464324817e-45

```
In [87]: def test(n):
         a = torch.tensor(2**(-n)); print(f'a : {a}')
         b = 2**(-n); print(f'b : {b}')
```

test(150)

a : 0.0
b : 7.006492321624085e-46

- The IEEE Standard for **Floating-Point Arithmetic** (**IEEE 754**) is a technical standard for floating-point arithmetic established in 1985 by the Institute of Electrical and Electronics Engineers.
 - Floating points calculation demands attention.
 - Even though mathematical expressions is equivalent, value of results could be different.

Precision of floating-point(2)

Precision

Being against the completeness of the real numbers

$$(-1)^{b_{31}} \times 2^{(b_{30}b_{29}\dots b_{23})_2 - 127} \times (1.b_{22}b_{21}\dots b_0)_2$$
$$\text{value} = (-1)^{\text{sign}} \times 2^{(e-127)} \times \left(1 + \sum_{i=1}^{23} b_{23-i} 2^{-i}\right)$$

- **Sign bit:** 1 bit
- **Exponent width:** 8 bits
- **Significant precision:** 24 bits (23 explicitly stored)

32-bit floating-point

64-bit floating-point

The two matrices can be operated even when necessary rules are **not** established.

The two matrices can be operated even when necessary rules are not established.

necessary rules for operating two matrices?

addition : same dimension

multiply : the number of columns in front has to equal the number of rows in back

The two matrices can be operated even when necessary rules are *not established*.

-> dimension **changes** as needed

Broad Casting

The two matrices can be operated even when necessary rules are not established.

-> dimension changes as needed

HOW

```
m1 = torch.FloatTensor([[1,2]])  
m2 = torch.FloatTensor(3)
```

1x1 -> 1x2

The two matrices can be operated even when necessary rules are not established.

-> dimension changes as needed

PROBLEM

error of matrix multiplication

Matrix Multiplication(Linear Algebra)

First step : operation rule

$$\mathbf{A} = \begin{pmatrix} \vec{a}_1 = (a_{11}, a_{12}, \dots, a_{1n}) \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix}, \quad \mathbf{B} = \begin{pmatrix} \vec{b}_1 = (b_{11}, b_{21}, \dots, b_{n1}) \\ b_{21} & b_{22} & \dots & b_{2p} \\ \vdots & \vdots & \ddots & \vdots \\ b_{n1} & b_{n2} & \dots & b_{np} \end{pmatrix}$$

Gradient Batch

Matrix multiplication($C = AB \neq BA$)

dot product ($\vec{a}_1 \cdot \vec{b}_1$)

$$\mathbf{C} = \begin{pmatrix} a_{11}b_{11} + \dots + a_{1n}b_{n1} & a_{11}b_{12} + \dots + a_{1n}b_{n2} & \dots & a_{11}b_{1p} + \dots + a_{1n}b_{np} \\ a_{21}b_{11} + \dots + a_{2n}b_{n1} & a_{21}b_{12} + \dots + a_{2n}b_{n2} & \dots & a_{21}b_{1p} + \dots + a_{2n}b_{np} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1}b_{11} + \dots + a_{mn}b_{n1} & a_{m1}b_{12} + \dots + a_{mn}b_{n2} & \dots & a_{m1}b_{1p} + \dots + a_{mn}b_{np} \end{pmatrix}$$

Third step : vector analysis

Embedding →

Second step : linear mapping

Lecture 3 : Gradient

$$\mathbf{A} = \begin{pmatrix} a_{11} & a_{12} & \dots & a_{1n} \\ a_{21} & a_{22} & \dots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \dots & a_{mn} \end{pmatrix} \quad \text{Input } \mathbf{x} = \begin{pmatrix} x_1 \\ x_2 \\ \vdots \\ x_n \end{pmatrix}$$

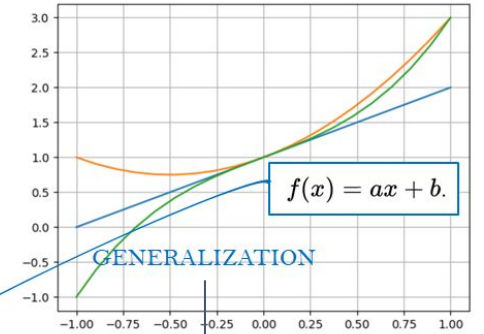

Matrix multiplication($y = Ax$)

Linear mapping : $\mathbf{y} = A(\mathbf{x}) = \begin{pmatrix} a_{11}x_1 + \dots + a_{1n}x_n \\ a_{21}x_1 + \dots + a_{2n}x_n \\ \vdots \\ a_{m1}x_1 + \dots + a_{mn}x_n \end{pmatrix} + \begin{pmatrix} b_1 \\ b_2 \\ \vdots \\ b_m \end{pmatrix}$

Gradient * Input Bias

Matrix Multiplication

solving problem of broadcasting when multiply two different shape of matrices

Matrix Multiplication

solving problem of broadcasting when multiply two different shape of matrices

1. `matrix.matmul()`
2. `torch.mm()`

```
m1 = torch.FloatTensor([[1,2], [3,4]])  
m2 = torch.FloatTensor([[1], [2]])  
m3 = torch.mm(m1, m2)  
print(m3)
```

```
tensor([[ 5.],  
        [11.]])
```

Matrix Multiplication

solving problem of broadcasting when multiply two different shape of tensors

multiply tensors which are **more than three dimensions**

```
x1 = torch.FloatTensor([
    [[1,2,3],[4,5,6]],
    [[1,2,3],[4,5,6]],
])
x2 = torch.FloatTensor([
    [[1,2,3],[4,5,6],[7,8,9]],
    [[1,2,3],[4,5,6],[7,8,9]],
])
x3 = x1.matmul(x2) #==torch.matmul(x1, x2)
print(x3)
print("x1 shape", x1.shape)
print("x2 shape", x2.shape)

tensor([[[30., 36., 42.],
        [66., 81., 96.]],

       [[30., 36., 42.],
        [66., 81., 96.]])
x1 shape torch.Size([2, 2, 3])
x2 shape torch.Size([2, 3, 3])
```

Matrix Multiplication

solving problem of broadcasting when multiply two different shape of tensors

multiply tensors which are **more than three dimensions**

```
A = torch.randn([5, 4, 10, 2, 3])
B = torch.randn([5, 4, 10, 3, 7])
C = torch.matmul(A, B)
print(C)
```

```
[[[ 1.1698e+00, -2.4340e+00, -1.2365e-01, ..., -4.7121e-01,

print(x3)
print("x1 shape", x1.shape)
print("x2 shape", x2.shape)

tensor([[[30., 36., 42.],
        [66., 81., 96.]],
       [[30., 36., 42.],
        [66., 81., 96.]])
x1 shape torch.Size([2, 2, 3])
x2 shape torch.Size([2, 3, 3])
```

Matrix Multiplication

solving problem of broadcasting when multiply two different shape of tensors

multiply tensors which are **three dimensions**

reshaping tensors

important to change shapes as needed

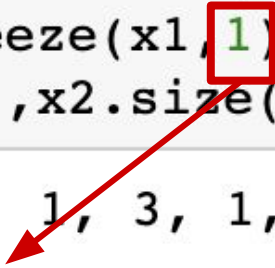

NOT REALLY changing the shape if there is no declaration of variable

reshaping tensors

diminishing dimension when dimension has only one element

```
x1 = torch.FloatTensor(10,1,3,1,4)
x2 = torch.squeeze(x1,1)
print(x1.size(),x2.size())
```

`torch.Size([10, 1, 3, 1, 4]) torch.Size([10, 3, 1, 4])`

can set which one to delete

reshaping tensors

diminishing dimension when dimension has only one element

adding new dimension

```
x1 = torch.FloatTensor(10,3,4)
x2 = torch.unsqueeze(x1, dim=1)
print(x1.size(),x2.size()) # torch.Size([10, 3, 4]) torch.Size([1, 10, 3, 4])
x3 = torch.unsqueeze(x1, dim=3)
print(x1.size(),x3.size()) # torch.Size([10, 3, 4]) torch.Size([10, 1, 3, 4])
```

```
torch.Size([10, 3, 4]) torch.Size([10, 1, 3, 4])
```

```
torch.Size([10, 3, 4]) torch.Size([10, 3, 4, 1])
```
